

Miracle: A Property Management System

CST2550 Group Coursework Report
Team Leader: Jebinaxar Michael

1. Introduction

This project, titled "Miracle: A Property Management System," is a console-based application designed to handle property and tenant management operations such as adding, assigning, and vacating tenants in properties using a SQL Server backend. The goal was to simulate real-world operations of a property management system while practicing software development principles, data structure design, and database integration.

This report outlines the system design, choice of data structures, algorithm analysis, testing approach, and reflections from the project development process.

2. Design

2.1 Data Structures and Justification

The application utilizes `List<T>` as the primary data structure to manage Property and Tenant records in memory during runtime. The decision was made to use lists because of their simplicity, dynamic sizing, and efficient linear access for small to medium datasets typical in educational simulations.

2.2 Algorithm Design and Pseudocode

Below is sample pseudocode for adding a new tenant to the database:

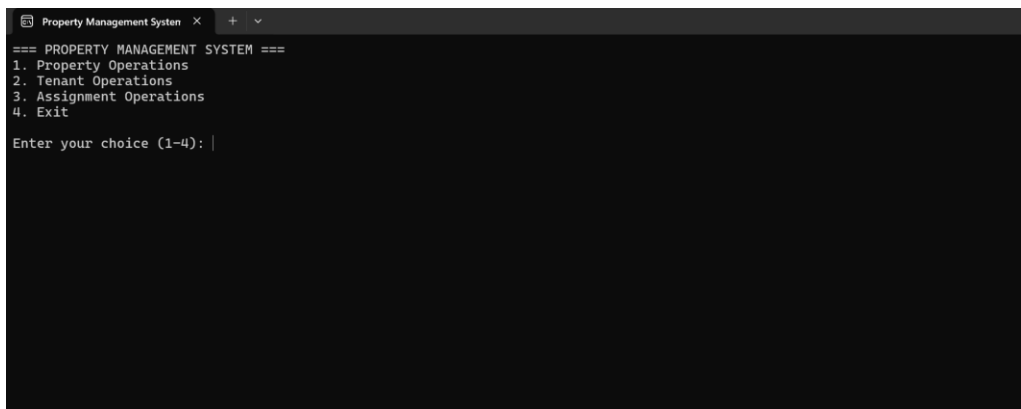

```
FUNCTION AddTenant(Tenant)
    CONNECT to database
    IF TenantID already exists THEN
        DISPLAY "Tenant already exists"
        RETURN
    ELSE
        INSERT tenant into Tenants table
        DISPLAY "Tenant added successfully"
    END FUNCTION
```

Time-complexity analysis:

- Searching: $O(n)$ – for checking duplicate IDs in list or DB.
- Insertion: $O(1)$ – direct insert using SQL command.

Demonstration Screenshots

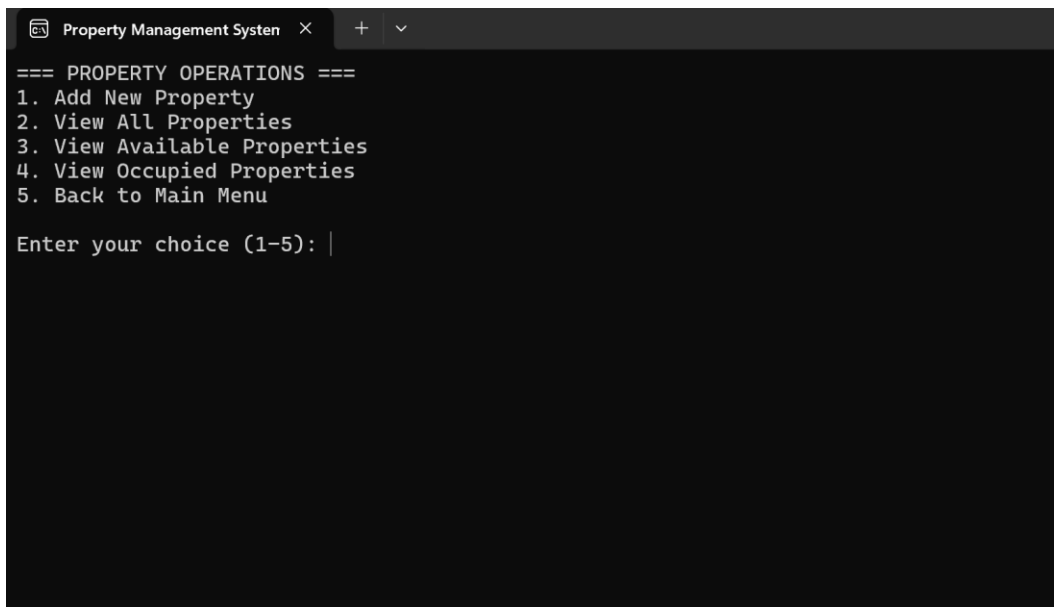

Main Menu – Entry point of the system with main operations

```
Property Management System x + v
=== PROPERTY MANAGEMENT SYSTEM ===
1. Property Operations
2. Tenant Operations
3. Assignment Operations
4. Exit
Enter your choice (1-4): |
```

The screenshot shows a terminal window titled "Property Management System". It displays a menu with four options: 1. Property Operations, 2. Tenant Operations, 3. Assignment Operations, and 4. Exit. The prompt "Enter your choice (1-4):" is followed by a cursor.

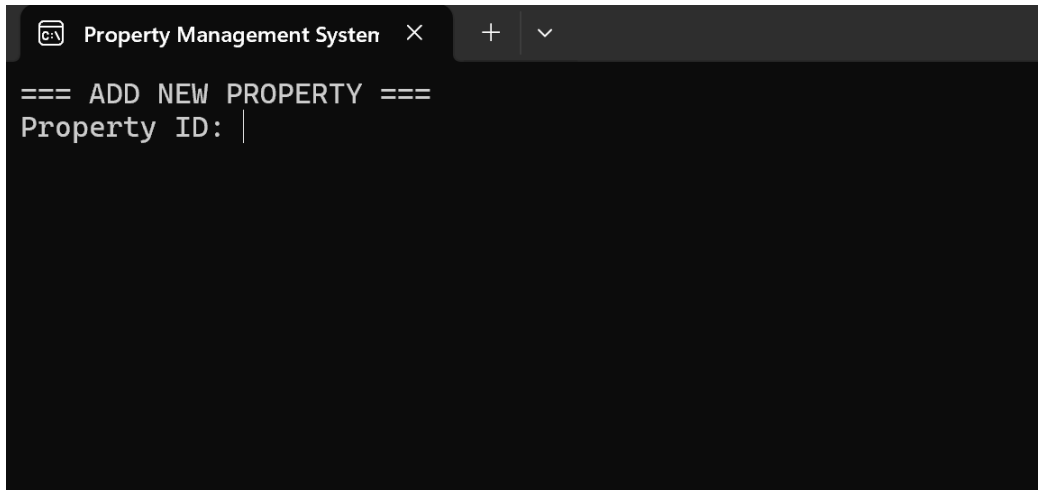

Property Operations – Options to manage properties

```
Property Management System x + v
=== PROPERTY OPERATIONS ===
1. Add New Property
2. View All Properties
3. View Available Properties
4. View Occupied Properties
5. Back to Main Menu
Enter your choice (1-5): |
```

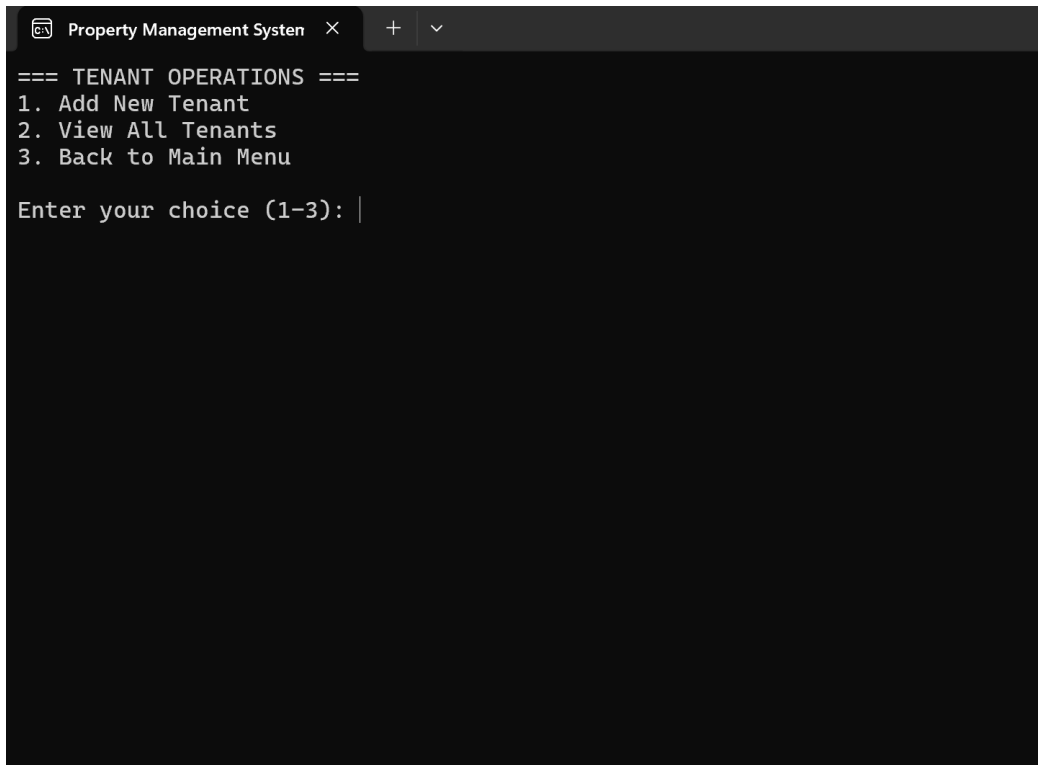

The screenshot shows a terminal window titled "Property Management System". It displays a menu with five options: 1. Add New Property, 2. View All Properties, 3. View Available Properties, 4. View Occupied Properties, and 5. Back to Main Menu. The prompt "Enter your choice (1-5):" is followed by a cursor.

Add New Property - User inputs property details

A terminal window titled "Property Management System" with a close button (X) and window controls (+ and v). The terminal displays the text "=== ADD NEW PROPERTY ===" followed by a prompt "Property ID: |" with a cursor.

Tenant Operations - Menu to add or view tenants

A terminal window titled "Property Management System" with a close button (X) and window controls (+ and v). The terminal displays the text "=== TENANT OPERATIONS ===" followed by a numbered list: "1. Add New Tenant", "2. View All Tenants", and "3. Back to Main Menu". Below the list is a prompt "Enter your choice (1-3): |" with a cursor.

All Tenants – Display of all registered tenants

```
Property Management System x + v
=== ALL TENANTS ===
ID      Name      Email      Phone      Age
-----
T1      John Doe    john@example.com 1234567890 34
T2      Jane Smith  jane@example.com 9876543210 36
T6      Jebinaxar  j@g.com      0777564398 20
T9      Jebinsh    k@g.com      067598321  24

Total: 4 tenants
Press any key to continue...
|
```

Assignment Operations – Assign or vacate tenants

```
Property Management System x + v
=== ASSIGNMENT OPERATIONS ===
1. Assign Tenant to Property
2. Vacate Property
3. Back to Main Menu
Enter your choice (1-3): |
```

Occupied Properties – View of currently occupied properties

4. Testing

We used MSTest to perform unit tests on core methods like AddTenant, AddProperty, AssignTenantToProperty, and VacateProperty. Testing was done in isolation, focusing on edge cases like duplicate entries and null values. But, Unfortunately Not the whole code is tested because of the unexpected error and time shortage(Team leader is doing the test not the tester)

6. Conclusion

The Miracle system is a System made in two days, after changing the whole plan. The initial Plan was much Prettier , good to use, a wide range Property management system. Because of the shortage of people and unexpected crisis the team failed in executing the plan. The current document, code, test file etc.. everything is done by the team leader in the final week! Even after my this week, none of my team members except me, were not able to learn or understand whats git, push pull nothing.

As team leader, I failed in making the team progress.
